

Cure HHT Research Network International Convening Workstream Outcomes

The **goal** of all work streams is to define gaps within each assigned topic area and put forth recommendations to explore these gaps.

To achieve these goals, complete the following tasks with your workstream:

- Review and discuss recent published and unpublished research related to the workstream topic area
- Identify gaps and/or possible research opportunities
 - Identify the resources, expertise, tools, and collaborations needed to address gaps or pursue opportunities
 - Identify obstacles to this research and discuss ways to overcome them
 - Identify data which could be collected within a patient registry to help contribute to the gaps in knowledge identified
- Prioritize research questions by order of feasibility, impact, importance, and logical sequence

Please put together the following:

- Summary of the state of science within the assigned topic area (no more than 5 pages)
- Identified research avenues to address gaps in science (3-5 recommendations)
 - Provide context and rationale for each recommendation
- Prioritize research by impact, importance, feasibility, and rational order
 - Provide context and rationale for prioritizations and include any data the work stream believes can be collected through patient registries to assist
